Integration with external sites

amusewiki.org
uid  Unique identifier (for multilanguage support)
cat  Fixed category list (separated by space)
slides  Boolean if slides are required (if the site sets that)
source  String with the source notes
lang  ISO code language (e.g. en)
pubdate  Publication date
curl -F __auth_pass=XXXX \
-F __auth_user=tester \
-F textbody='Hello <em>hello</em>' \
https://sandbox.amusewiki.org/remote/create

Response:
{"error":"Missing mandatory title and textbody parameters"}

If you miss the authentication parameters, you get a 401 response.

Parameters
Mandatory
__auth_user The username
__auth_pass The password
title The text title
textbody The HTML body

Optional
They are the very same parameters you can find in the /action/text/new form.
subtitle Text subtitle
author Text author
notes HTML string with the notes
teaser HTML string with the teaser
LISTtitle Text for indexing
SORTauthors List of authors, comma or semicolon separated list
SORTtopics List of topics, comma or semicolon separated list
date Date of the text

Contents
Embedding an existing text ........................................ 5
Non-interactive creation of texts .................................. 5
Parameters .......................................................... 6
Embedding an existing text

Say the URL of the text you want to embed is https://amusewiki.org/library/bookbuilder-tutorial, you can add an iframe with https://amusewiki.org/library/bookbuilder-tutorial/embed to have the infobox with the downloads.

Example:

```html
<iframe src="https://amusewiki.org/library/bookbuilder-tutorial/embed"
    width="700px"
    height="200px">
</iframe>
```

Non-interactive creation of texts

This procedure lacks any human interaction and it relies completely on the HTML conversion to be good enough. Worst case scenario, you are going to get a text which needs fixing.

You need an existing user on the site.

The API endpoint is /remote/create, e.g. https://sandbox.amusewiki.org/remote/create.

You need to do a POST request with some mandatory and some optional parameters

Request:

```bash
$ curl -F __auth_pass=XXXXX \
    -F __auth_user=tester \
    -F title=prova \
    -F textbody='Hello <em>hello</em>' \
    https://sandbox.amusewiki.org/remote/create
```

Response is a JSON string, which holds the URL of the text which is going to be created and the job URL with the publishing.

```
{
    "url":"https://sandbox.amusewiki.org/library/prova",
    "job":"https://sandbox.amusewiki.org/tasks/status/17097"
}
```

If you are missing some mandatory parameters you get an error:
