Multi-language support

Contents

Enable the multilanguage

Go to the administrative console and under "General configuration" you will find "Multilanguage: list of whitespace separated language codes". The list of supported languages is above the input field

Multilanguage: list of whitespace separated language codes `en es ru mk hr it de fi sv fr`

`da de en es fi fr hr it mk nl pl pt ru sq sr sv`

Set an UID

On text creation, there is an optional UID field.

Topics: comma or semicolon separated list

Unique ID for the text

Date of the original publication

Source (For texts from the internet use: Retrieved on DATE from URL).

You can also add the line to the header of any existing text:

```
#uid mytextid
```

The UID is an arbitrary word which let amusewiki knows that two texts are the same with different language.

So, if you have two (or more) texts with the same UID, in the footer of the text page you will find the list of related texts.

The translations' list can be found at `/console/translations`
